

PV panel voltage and light intensity

Overview

Solar panels, unless heavily shaded have a remarkably high and consistent voltage output even as the intensity of the sun changes. Panel temperature will affect voltage – as has been discussed in another. The relationship between light and photovoltaic voltage isn't as simple as "more sun equals more power. " This guide explores how different light conditions affect solar panel performance and reveals practical solutions to maximize energy harvest. Voc (open-circuit voltage) is the highest — typically 38-55 V for residential panels — and is what the inverter sees when no current is flowing. We remember from Lesson 4 that the generation current of a solar cell (I_L) is a function of number of photons (N) hitting the photovoltaic surface: where q is the electron charge, and A is the surface. The Solar Cell I-V Characteristic Curves shows the current and voltage (I-V) characteristics of a particular photovoltaic (PV) cell, module or array.
