TL;DR: In this article, a review of the existing control methods used to control charging and discharging processes, focusing on their impacts on battery life is presented, where classical and modern methods are studied together in order to find the best approach to. However, in charging and discharging processes, some of the parameters are not controlled by the battery's user. That uncontrolled working leads to aging of the batteries and a reduction of their life cycle. Therefore, it causes an early replacement. Development of control methods seeks battery. This paper describes the development of a centralized controller to charge or discharge the battery storages that are connected to renewable energy sources.
